

RentBuddy

Helping international students understand renting in The Hague.

A student-focused app with housing guidance, a rental guide and an AI Contract Helper.

SDG 10

Base44

AI feature

Base44 preview

Understanding rental information is a barrier on its own.

Language barrier

Contracts and rental terms are often in Dutch.

Fragmented information

Rules, websites and support are spread across many sources.

Practical uncertainty

Students may not know what registration, deposits or subletting mean.

High-stakes decisions

Misunderstanding a contract can lead to money loss or housing problems.

So the challenge is not only finding housing, it is understanding the information around housing.

Who is RentBuddy designed for?

Intended users

International students aged about 18–30 in The Hague who are looking for a room, studio or apartment and are not yet familiar with Dutch rental rules.

Main needs

- Clear explanations in simple language
- Help with rental contracts
- Guidance on registration, deposits and subletting
- Reliable next steps and official sources

Not the focus

RentBuddy is not a housing marketplace, not a law firm, and not a tool for guaranteed legal decisions or live housing availability.

RentBuddy is a guided information tool.

Find Housing

Helps students understand where to search and what to prepare.

Rental Guide

Explains important topics such as deposits, registration and tenant rights.

Contract Helper

The AI feature that translates and explains rental contract text.

Subletting

Gives cautious guidance about subletting rules and preparation.

Get Help

Directs users to trusted organisations and official support.

The AI is concentrated where it adds the most value: explaining difficult rental-contract text.

What inequality does this project actually address?

Not the claim

RentBuddy does not solve the housing shortage itself.

The real contribution

RentBuddy reduces the information disadvantage around renting by making complex information easier to understand.

Translate difficult terms • explain contracts • guide students to reliable next steps

How the Contract Helper works

This is the required AI component in the project.

1. Input

User uploads or pastes contract text and selects a language.

2. Python

Our Python code validates the input and sends a live API request.

3. LLM

Claude or Gemini analyses the text and returns a structured explanation.

4. Output

The app shows key terms, warnings, missing information and next questions.

Important: the live LLM call should come from your own Python code, even if Base44 is the interface.

What the AI should do when information is unclear

Missing detail

Show: “Not clearly stated in the contract.”

API unavailable

Show an error state, never a fake analysis.

Uncertain clause

Flag it for clarification instead of calling it legal or illegal.

Sensitive information

Warn users to remove unnecessary personal data before upload.

Principle: explain what is known, show uncertainty clearly, and encourage verification with an official source.

Live demo

Step 1

Paste a short Dutch rental contract.

Step 2

Run the Contract Helper and show the structured result.

Step 3

Show one warning or missing item, then route the user to official help.

Current demo slide

05 • DEMO

Live demo: show the prototype end to end.

Keep this slide open before switching to Base44. The demo should prove the rubric, not just show screens.

A. Start with a user

"I'm an international student. I found a Dutch room contract and I'm unsure about the deposit, registration and subletting."

Show: Home → Contract Helper

B. Give real input

Paste a short Dutch rental-contract sample. Choose an explanation language and run the analysis.

Show: loading → structured result → missing/unclear information.

C. Finish with action

Open Rental Guide / Subletting / Get Help. Demonstrate that the student can move from explanation to a safer next step.

Demo link: app.base44.com/apps/6aad3d03c6e87531a9333ed7/editor/preview

Approved: only team (possessing the correct access to the live prototype)

RENTFINDER - THE 3D RENTATION

05/04/2020 15

The key risk is confident but incorrect advice.

Risk

Users may trust the AI too much and treat an explanation like final legal advice.

Who could be harmed?

Students who cannot easily verify Dutch rental information themselves are especially vulnerable.

Mitigation

Keep the answer traceable to the contract, show uncertainty, avoid legal verdicts and direct users to official support.

If RentBuddy is wrong, it should fail cautiously not confidently.
