

RentBuddy is a web app that helps international students understand the process of renting a home in The Hague. This demo video demonstrates the main features of the app.

First, the video shows where students can find trusted housing websites and useful information about registration, deposits, rental contracts, tenant rights and possible scams. It also shows the subletting checker, which asks the user questions and provides guidance based on their answers. On the Get Help page, users can select their problem and see which organisation they can contact.

The main AI feature is the Contract Helper. In the video, a sample Dutch rental contract is pasted into the tool and English is selected as the explanation language. The contract is then analysed, and the tool displays important information such as the rent, deposit, contract dates, notice period, subletting conditions and explanations of difficult Dutch terms.

At the end of the video, Visual Studio Code shows the Python program behind the AI feature. The terminal output demonstrates that the Python code sent the rental contract to the Gemini API and received a real AI-generated analysis. This Python connection allows RentBuddy to analyse contracts instead of only showing fixed or prewritten information.
