

Our idea: mental health checkups

Tool: N8N

SDG: 3 — Good Health & Well-being

Daily checkin like whas yo mood 1-10.

Prompt used to build/fix the workflow (given to the n8n AI Assistant): Modify this workflow. Keep the existing Form Trigger, Basic LLM Chain, OpenAI Chat Model and Show Response nodes as they are, and add the following. 1. Add a Schedule Trigger set to run daily at 18:00. Connect it to a new Send Email node that emails the user a reminder containing the link to the check-in form. 2. Add a Set / Edit Fields node between the Form Trigger and the Basic LLM Chain, outputting: date, mood, stress, energy, concern, and note (with a fallback so a blank note becomes "nothing added"). 3. After the Basic LLM Chain, add a Google Sheets node (Append) that logs date, mood, stress, energy, concern, note, and the AI response. 4. Add an IF node checking whether mood ≤ 3 OR stress ≥ 8 . - TRUE branch: append crisis/support resources (113 Zelfmoordpreventie, 0800-0113, contact a GP or trusted person) to the message. - FALSE branch: pass the message through unchanged. 5. Both branches must reach a Send Email node and the existing Show Response node so the user always sees a result. Make sure every node is connected with no dead ends. Prompt used inside the AI node itself (runs every time someone submits the form): You are a warm, supportive wellbeing assistant for a daily mental health check-in tool. A user has just submitted their daily check-in with a mood score, stress score, energy score, a selected main concern, and an optional free-text note. Use these ranges: Mood 1-3 = very low, 4-6 = neutral, 7-10 = positive. Stress 1-3 = low, 4-6 = moderate, 7-10 = high. Energy 1-3 = low, 4-6 = moderate, 7-10 = good. Write a short response with exactly three parts: 1) an affirmation, 2) a warm reflection on what they shared, 3) one small, low-effort action for today. Keep it under 80 words, non-clinical, and never suggest it replaces professional help.

Core loop:

1. Schedule Trigger — fires daily at a set time (e.g. 8pm).
2. Send message — a node that asks the mood question. Pick your channel:
Telegram (easiest to set up, free bot via @BotFather)
WhatsApp (needs Business API, more setup)
Email
3. Webhook (response capture) — if using Telegram, a second workflow listens for the user's reply via the Telegram Trigger node (no separate webhook needed, n8n handles it). If it's a web form instead, use a Webhook node that receives the submitted score.

4. Store the response — Google Sheets, Airtable, or a real DB (Postgres/Supabase) node — log {user_id, date, mood_score}.

5. IF node — check the score. If it's below a threshold (e.g. ≤ 3) or a pattern (e.g. 3 low days in a row using a lookup on stored data), branch to an alert

6. path — e.g. send a supportive message, a resource link, or notify a designated contact.

Optional: weekly summary — separate Schedule Trigger (once a week) that pulls the week's data and sends a trend chart or summary back to the user.

IDEAS: Daily mental health quote. maybe let the user write what their heads at. - mental journal.

IDEAS promptified: Daily quote: easy add — either a static list (JSON array in a Code node, pick random) or pull from a quotes API (e.g. ZenQuotes, Quotable) via HTTP Request node. Bundle it into the same daily message as the mood question.

Journal entry: after the mood score, ask a follow-up ("Want to add a note about why?"). Store it as a separate field alongside the score. This is genuinely valuable — the score alone is just a number, the journal gives context for a summary later.

questions to ask in the form:

How are you feeling today?

How stressed do you feel from 1–10?

How much energy do you have?

What is affecting you today?

What kind of support would you like?

After submitting it, they automatically receive a positive message, affirmation, or small well-being suggestion based on their answers.

For example:

User answers: Sad, low energy, feeling homesick.

AI message: “It’s okay to miss home. Feeling homesick means that you have people and places worth missing. Today, try sending one small message to someone you love.”

Check-in answer	Type of message
Stressed	Calming affirmation and breathing suggestion
Sad or lonely	Warm message and suggestion to contact someone
Low energy	Gentle action that requires little effort
Motivated	Encouragement to continue
Overwhelmed	Help choosing one small priority

Personalized AI message

The AI uses the check-in answers to create an original message.

“You have low energy today, so you don’t need to solve everything at once. Choose one small task and allow that to be enough.”

This is a better fit for the assignment because it clearly demonstrates why AI is part of the solution.

You could also combine them:

- A short daily affirmation.
- One personalized suggestion.
- One small action for today.

After completing the form, a person could receive:

Your daily Flow State message

“You are allowed to take today one step at a time.”

You mentioned that you feel stressed and have low energy. Take five minutes away from your screen, drink some water, and write down the one task that matters most today.

You do not need to finish everything at once.

possible workflow:

Schedule Trigger

Starts automatically every day, for example at 18:00.

Send Email

Sends the user a link to the daily check-in.

Form Trigger

Starts the second part when the user submits the form.

Edit Fields

Organizes their answers so the AI can understand them.

AI node

Creates a personalized affirmation, quote, or supportive message.

If node

Checks whether the person selected a very low mood or very high stress.

Send Email

Sends the personalized result to the student.

Google Sheets

Saves the date and mood score so changes can be viewed later.

The five check-in questions

1. **How is your mood today?**
Scale: 1 = very low, 10 = very good
2. **How stressed do you feel?**
Scale: 1 = not stressed, 10 = extremely stressed
3. **How much energy do you have?**
Scale: 1 = no energy, 10 = lots of energy
4. **What is affecting you most today?**
 - Stress
 - Low energy
 - Low motivation
 - Feeling sad
 - Feeling lonely
 - Work or study pressure
 - Relationship or family problems
 - Poor sleep
 - Something else
 - Nothing specific, I'm doing okay
5. **Would you like to tell us a little more?**
Optional written answer

This is enough information for the AI to create something personal. The first three answers show the person's general condition, question four identifies the main problem, and question five lets them explain if they want to.

How n8n decides what to send

Answer	Meaning
Mood 1–3	Very low mood
Mood 4–6	Neutral or difficult day
Mood 7–10	Positive mood
Stress 1–3	Low stress
Stress 4–6	Moderate stress
Stress 7–10	High stress
Energy 1–3	Low energy
Energy 4–6	Moderate energy
Energy 7–10	Good energy

The **If** or **Switch** node checks these numbers. The AI then considers the numbers together with the selected problem.

Examples:

- Mood 3 + stress 8 + “relationship problems” → calm emotional support.
- Mood 6 + energy 2 + “poor sleep” → gentle low-energy suggestion.
- Mood 8 + stress 3 + “doing okay” → positive affirmation and encouragement.
- Mood 5 + stress 7 + “work pressure” → grounding exercise and one practical action.

The AI can handle a broad range of written answers. You do not need to predict every possible problem beforehand. The multiple-choice answer gives it structure, while the optional answer provides personal context.

What the user receives

have the AI create three short things:

1. A positive affirmation or message.
2. A response connected to what the person is experiencing.
3. One small action they can do today.

For example:

Today’s affirmation: You do not have to solve everything at once.

You mentioned feeling stressed about work and having low energy. That can make even small tasks feel heavier than usual.

Small action: Take three minutes to write down everything worrying you. Then circle only one thing you can influence today.

This is more useful than only sending a random quote.

You can customize things such as:

- Form title
- Explanation
- Questions and field types
- Button text
- Completion message
- Some basic appearance settings

Possible introduction:

Daily Mental Health Check-in

Take one minute to check in with yourself. Your answers will be used to create a short, personalized message and small action for today.
